HOW TO REMOVE ELECTRONIC DEVICE / COME RIMUOVERE L'ELETTRONICA

ATTENTION: window switch must not be cut, broken, detached, damaged. If the cooking zone of the product works but the suction does not start, check that the window switch is connected correctly / il contatto finestra (window switch) non deve essere tagliato, danneggiato, rotto o staccato. Se le zone cottura del prodotto funzionano ma la parte aspirazione non parte, verificare che il contatto finestra (window switch) sia connesso correttamente.

FOCUS ON POTS / FOCUS SU PENTOLE

Note:

To maintain the best possible temperature monitoring of the cookware, it should be as level as possible. For cookware with a large air gap over the centre point of the cooking element, such as, for example, stamped imprints with the manufacturer's logo, the temperature monitoring is negatively effected and can cause overheating of the cookware. Damaged cookware, e.g. deformed bottom surfaces due to overheating, must not be used. For good cooking results, the diameter of the cookware's ferromagnetic area should match the size of the hotplate. If cookware is not detected on a hotplate, try it on the next smaller hotplate down. The cookware must be place directly onto the glass ceramic and should be centred. In no case anything may be between cookware and glass ceramic during cooking e.g. a trivet. The characteristics of the pan base may affect the uniformity of the cooking results. Pans made from materials which help diffuse heat, such as stainless steel sandwich pans, distribute heat uniformly, saving time and energy.

Nota:

Per mantenere il miglior monitoraggio possibile della temperatura delle pentole, dovrebbe essere il più a livello possibile. Per pentole con un ampio traferro sul punto centrale dell'elemento di cottura, come, ad esempio, impronte stampate con il logo del produttore, il monitoraggio della temperatura ha un effetto negativo e può causare il surriscaldamento della pentola. Pentole danneggiate, ad es. superfici inferiori deformate dovute a surriscaldamento, non devono essere utilizzate. Per ottenere buoni risultati di cottura, il diametro dell'area ferromagnetica della pentola deve corrispondere alle dimensioni della piastra. Se la pentola non viene rilevata su una piastra riscaldante, provarla sulla piastra successiva più piccola verso il basso. La pentola deve essere posizionata direttamente sulla vetroceramica e deve essere centrata. In nessun caso durante la cottura deve esserci nulla tra pentole e vetroceramica, ad es. sottopentola. Le caratteristiche del fondo della teglia possono influenzare l'uniformità dei risultati di cottura. Pentole realizzate con materiali che aiutano a diffondere il calore, come le padelle sandwich in acciaio inossidabile, distribuiscono il calore in modo uniforme, risparmiando tempo ed energia.
